PROJECT SOLUTION PITCH / CIVICTECH

CivicVoice

One voice. One complaint. A simpler way to speak up.

THE PROBLEM

A pothole, a blocked drain, rainwater flooding a street or garbage left uncollected can affect an entire neighbourhood. But reporting the issue is not always simple. People may have to find the right portal, work out what details to enter, type a full description and navigate a process that may not feel comfortable in their language. For someone using a phone, these extra steps can become a barrier to reporting the problem at all.

OUR IDEA

CivicVoice is a voice-first civic complaint assistant. A resident can describe a local problem aloud in a supported language. AI-based speech and language processing helps interpret what they said and prepare the complaint details in a form. The resident can review and correct those details before moving ahead. The goal is practical: make the first step easier, reduce repeated typing and make online complaint reporting more approachable.

HOW IT WORKS

01 CHOOSE	02 SPEAK	03 PROCESS	04 REVIEW
Select a supported language.	Describe the civic issue naturally.	AI prepares the complaint details.	Check and edit the form before proceeding.

WHY VOICE MATTERS

Not everyone finds typing long descriptions on a phone easy. Speaking in a familiar language can feel more natural than navigating a lengthy online form. CivicVoice starts with something people already know how to do — speak — while the review step keeps the resident in control and allows them to correct misunderstood information.

WHERE IT CAN HELP

CivicVoice focuses on everyday issues such as potholes and damaged roads, blocked drainage and waterlogging, uncollected garbage, and faulty streetlights. It is especially useful for people who find long forms or typing on a phone difficult.

WHAT WE HAVE BUILT

The current project build demonstrates a voice-led, multilingual complaint-preparation flow, including AI-assisted understanding of the spoken issue and preparation of complaint details for the user to review. CivicVoice is a working project prototype; it should not be mistaken for a live connection to every municipal complaint system. Connecting with official city platforms and testing the experience with more residents are natural next steps.

TECHNOLOGY Gnani AI voice/language capabilities, with web application and backend components.
